

ABSTRACT

[0019] This new variety '9-9-12' is new and different because of its unusually large berry size for a seedless grape (stenospermic berries). It differs from other green, seedless grapes such as 'Thompson Seedless' by ripening about a week later in the McFarland, California area and by having a much larger berry. It differs from other seedless grape varieties such as 'Princess' by ripening about two weeks later and by having a much larger, brighter green berry at harvest.
